## Abstract

*Document content extraction is crucial in computer vision, especially for meeting the high-quality data needs of large language models (LLMs) and retrieval-augmented generation (RAG) technologies. However, current document parsing methods suffer from significant limitations in terms of diversity and comprehensive evaluation. To address these challenges, we introduce OmniDocBench, a novel multi-source benchmark designed to advance automated document content extraction. OmniDocBench includes a meticulously curated and annotated high-quality evaluation dataset comprising nine diverse document types, such as academic papers, textbooks, slides, among others. Our benchmark provides a flexible and comprehensive evaluation framework with 19 layout category labels and 14 attribute labels, enabling multi-level assessments across entire datasets, individual modules, or specific data types. Using OmniDocBench, we perform an exhaustive comparative analysis of existing modular pipelines and multimodal end-to-end methods, highlighting their limitations in handling document diversity and ensuring fair evaluation. OmniDocBench establishes a robust, diverse, and fair evaluation standard for the document content extraction field, offering crucial insights for future advancements and fostering the development of document parsing technologies. The codes and dataset is available in <https://github.com/opendatalab/OmniDocBench>.*

## 1. Introduction

Document parsing is a foundational task in computer vision, focused on accurately extracting content from documents [18, 36, 39, 41, 45]. High-quality document content

extraction typically involves the integration of multiple algorithmic modules. Layout detection algorithms identify different content areas on a page, OCR technology converts images of text regions into text, while formula and table recognition models identify specific regions and transform them into corresponding source code. These modules and reading order algorithms form a comprehensive process of converting documents into machine-readable formats.

With large models increasingly requiring high-quality data, the importance of document content extraction has become more pronounced. Although vast amounts of data are available online for training, knowledge-rich document data is relatively scarce. Documents such as academic papers and technical reports contain rich structured information that can significantly enhance the knowledge depth of large models. Moreover, the development of retrieval-augmented generation (RAG) [10, 21] technology relies on extracting accurate information from documents to improve the quality and relevance of generated content. Consequently, research in document content extraction has intensified, leading to a series of pipeline-based high-quality document extraction algorithms [36] and the emergence of end-to-end multimodal large model solutions [3, 5, 6, 27, 39, 40, 42]. These methods have significantly improved document content parsing quality, providing robust support for the needs of large models and RAG technology.

In analyzing current module-based pipeline and multimodal end-to-end methods, we identified several limitations. For instance, methods like Marker and MinerU, which are mainstream pipeline methods, primarily evaluate individual modules on academic paper data, lacking document diversity and comprehensive evaluation results. Although MinerU considers the generalization of diverse data, it only demonstrates this through a single model and visualization results, lacking overall end-to-end evaluation. Multimodal large model methods [3, 5, 27, 39, 40], while easier to use than pipeline methods, lack performance validation on diverse documents, and some evaluation metrics are in-

\* The authors contributed equally.

adequate. Additionally, these methods often use data similar to their training set distribution for comparison, resulting in unfair evaluations. **Overall, current document content extraction faces the following challenges:**

- **Limited document types.** Current evaluations mostly focus on a single type of academic paper, while real-world scenarios include textbooks, exam papers, financial reports, newspapers, magazines, and other document types.
- **Monotonous evaluation dimensions.** Pipeline-based methods typically evaluate specific algorithmic modules, such as OCR, layout detection, or formula recognition, while the overall quality of parsing results requires comprehensive metrics.
- **Inadequate evaluation metrics.** Multimodal large model approaches attempt to evaluate document parsing quality across multiple dimensions, such as dividing document content into text, formulas, tables, etc. However, these models commonly employ evaluation metrics such as BLEU scores or Edit distances, which fail to accurately and fairly assess parsing effectiveness when dealing with markup languages like LaTeX or HTML that allow diverse syntactic expressions.

Building a diverse, comprehensive, and accurate evaluation system poses significant challenges, requiring diverse and high-quality data annotation and reasonable evaluation metrics. While READOC extends the evaluation scope to include GitHub README files based on Nougat, there remains a substantial gap in real-world diversity, and the evaluation dimensions lack consideration of attributes. In

contrast, this paper proposes a document content extraction benchmark, **OmniDocBench**, characterized by diverse types, detailed annotations, and reasonable evaluation (Figure 1). **The specific contributions are as follows:**

- **High-quality, diverse evaluation set:** Through automated annotation, manual verification, and expert review, we construct a comprehensive, detailed, high-quality OmniDocBench evaluation set, encompassing nine types of diverse document pages, including papers, textbooks, exam questions, and research reports.
- **Flexible and comprehensive evaluation dimension support:** The OmniDocBench validation set covers 19 layout category labels and 14 attribute labels. To facilitate user evaluation from an overall, single module, or different data types, we provide end-to-end evaluation, single algorithm module evaluation, and attribute-based evaluation, covering various evaluation needs.
- **Comprehensive evaluation of mainstream methods:** Based on OmniDocBench, we conduct a comprehensive evaluation of current mainstream modular pipeline and end-to-end large model methods, providing a fairer assessment of existing methods and summarizing the shortcomings of current document parsing methods, thereby guiding further development in document parsing.

## 2. Related Work

### 2.1. Traditional Document Content Extraction

Document Content extraction remains a challenging task, and there is yet to emerge a unified benchmark tailored for

real-world scenarios. Traditional algorithms typically employ multiple expert modules to handle different extraction subtasks, such as document layout detection [11, 16, 32, 46], optical character recognition (OCR) [14, 22, 28, 33, 37], formula recognition [4, 25, 34, 44], and table recognition [15, 17, 22].

While expert models of these subtasks are advancing rapidly, recent work such as Mineru [36] attempts to concatenate multiple expert modules into a pipeline and provides a high-precision open-source solution for document content extraction. READOC [26] also unifies heterogeneous evaluation methods from the perspective of Document Structure Extraction, breaking down texts, images, formulas, tables, and other dimensions for evaluation, thus offering a solution-oriented towards real-world scenarios for DSE tasks. However, due to the complexity of Document data sources and the intricacies of PDF document information, previous efforts still fall short in terms of data diversity, failing to cover the categories users encounter in practical applications. Similarly, there is an issue with the explainability of document parsing.

## 2.2. VLM-based Document Content Extraction

The emergence of Vision-Language Models (VLMs) [1, 6, 12, 38] has revolutionized the field of document content extraction. These models leverage multi-modality capability to achieve remarkable performance in document understanding tasks. Document extraction tools powered by VLMs excel at comprehending both visual layouts and textual content, effectively handling complex document structures while capturing rich contextual information. Representative works such as Nougat [5], Vary [40], Fox [27], and GOT [39], along with recent advances [13, 29], demonstrate significant progress in automated document parsing and comprehension. Despite these advances, the field lacks a standardized and unified benchmark for evaluating VLM-

based document extraction task. This absence has hindered objective assessment of PDF document processing capabilities and impeded fair comparison across different approaches. To address this limitation, we present OmniDocBench, a comprehensive end-to-end benchmark designed specifically for evaluating VLM-based document parsing in real-world scenarios.

## 2.3. Benchmark for Document Content Extraction

An end-to-end benchmark for PDFs can intuitively reflect the effectiveness of PDF extraction tools, which is crucial for their iteration and selection. However, current benchmarks predominantly focus on module-level evaluations; we have listed related benchmarks in Table 1. Additionally, while there are existing end-to-end benchmarks, they lack detailed annotation rules and suffer from insufficient diversity, as well as unreasonable metrics for formula and table evaluations. For example, READOC [26] covers only two types of sources—arXiv and GitHub—and uses EDS [20] and TEDS [47] to compute metrics for formulas and tables, which may lead to inaccuracies CDM [35]. Therefore, there is a need for a more finely annotated, diverse, and reasonably evaluated end-to-end benchmark.

## 3. OmniDocBench Dataset

Constructing a diverse and comprehensive document parsing benchmark with precise annotations is a formidable challenge. As illustrated in Figure 2, we have designed a systematic and professional annotation framework for OmniDocBench, encompassing data acquisition, intelligent pre-annotation, and manual refinement. This ensures that OmniDocBench possesses the following key attributes:

- **Page Diversity.** We sourced document pages from a variety of origins to ensure a wide range of document types.
- **Comprehensive Annotation.** We meticulously anno-

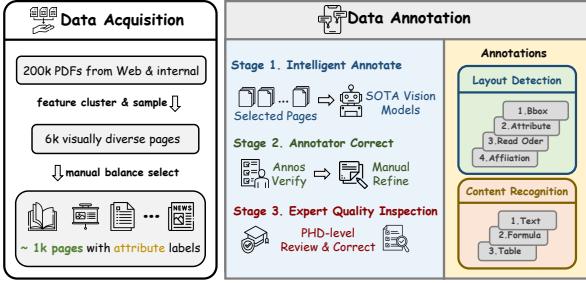

Figure 2. Overview of the OmniDocBench dataset construction.

tated all elements on the pages, including bounding boxes, specific content, and various potential attributes.

- **Annotation Accuracy.** By integrating semi-automated annotation processes, annotator corrections, and expert quality checks, we ensure the reliability of all annotations.

The following sections detail the data acquisition process, the annotation methodology, and a statistical analysis of the final annotated dataset.

### 3.1. Data Acquisition

During the data acquisition phase, we sourced document pages from diverse origins and used clustering algorithms to initially select visually diverse pages, followed by manual annotation of page attributes to finalize the OmniDocBench pages. Specifically, we collected 200,000 initial PDF documents from Common Crawl, Google, Baidu search engines, and internal data. Subsequently, we extracted visual features from these document pages using ResNet-50 and performed clustering using Faiss<sup>1</sup>, sampling 6,000 visually diverse pages from 10 cluster centers. Finally, annotators provided page-level attribute annotations, including page type, layout type, and language type, and further balanced the selection to 981 samples for the final dataset. The OmniDocBench dataset includes pages with 9 types of pages, multiple layout categories, and various attribute annotations, covering a wide range of real-world scenarios.

### 3.2. Data Annotation

To ensure the comprehensiveness of OmniDocBench’s annotations, we conducted detailed annotations for layout detection and content recognition.

#### 3.2.1. Annotation Types

**Layout Detection Annotations:** Unlike typical layout detection tasks, OmniDocBench includes four comprehensive types of annotations: (1) Layout Bounding Box Annotations: Locating information for 19 types of regions such as titles, text paragraphs, tables, and images. (2) Layout Attribute Annotations: Detailed attribute annotations for detected boxes, including 3 text box attributes, 6 table at-

tributes, and 2 formula attributes. (3) Reading Order Annotations: Annotating the reading sequence of detected boxes. (4) Affiliation Annotations: For images, tables, formulas, and code blocks, we annotate captions and titles to distinguish them from main text. Similarly, for cross-page paragraphs, we annotate affiliation relationships.

**Content Recognition Annotations:** Based on the format of the content area, we conduct the following three types of area annotations: (1) Text Annotations: Pure text annotations for titles, text paragraphs, and other plain text content. (2) Formula Annotations: LaTeX format annotations for inline formulas, display formulas, and subscripts. (3) Table Annotations: Providing both HTML and LaTeX annotations for table data.

#### 3.2.2. Annotation Process

For these annotation tasks on diverse pages, we design a standardized process to ensure quality and efficiency, comprising intelligent pre-annotation, annotator correction, and expert quality inspection.

**Intelligent Pre-Annotation.** Manually annotating entire documents is time-consuming and costly. To enhance efficiency, we employ state-of-the-art detection and recognition models for pre-annotation of layout detection and content recognition. Specifically, we use fine-tuned LayoutLMv3 [16] for layout detection annotations and PaddleOCR [22], UniMERNNet [34], and GPT-4o [2] for text, formula, and table annotations, respectively.

**Annotator Correction.** After layout detection phase, annotators refine the detection boxes and enhance annotations with reading order and affiliation details. Each character is verified to ensure accuracy in content recognition. For complex annotations of tables and formulas, requiring LaTeX and HTML formats, annotators use tools like Tables Generator<sup>2</sup> and latexlive<sup>3</sup> for verification and correction.

**Expert Quality Inspection.** Despite thorough annotator corrections, the complexity of formulas and tables may result in residual issues. To address these, we use CDM’s rendering techniques to identify unrenderable elements. These are then reviewed and corrected by three researchers to ensure accuracy and fidelity in the final annotations.

### 3.3. Dataset Statistics

**Page Diversity.** OmniDocBench comprises a total of 981 PDF pages across 9 distinct types. Each page is annotated with global attributes, including text language, column layout type, and indicators for blurred scans, watermarks, and colored backgrounds.

**Annotation Diversity:** OmniDocBench contains over 10,000 annotations for page detection and recognition: (1)

<sup>1</sup><https://github.com/facebookresearch/faiss>

<sup>2</sup><https://www.tablesgenerator.com/>

<sup>3</sup><https://www.latexlive.com/>

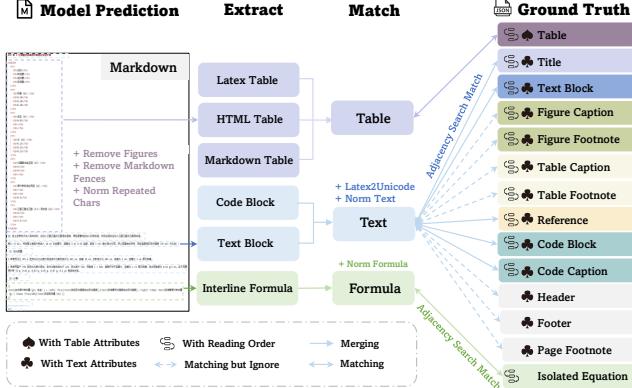

Figure 3. OmniDocBench Evaluation Pipeline.

More than 20,000 block-level annotations across 15 categories, including over 9,000 text paragraphs, 989 image boxes, 428 table boxes, and so on. All document components except headers, footers, and page notes are labeled with reading order information, totaling over 16,000 annotations. (2) The dataset also includes more than 80,000 span-level annotations across four categories, with 4,000 inter-line formulas and footnote markers represented in LaTeX format, while the remaining annotations are in text format.

**Annotation Attribute Diversity:** (1) *Text Attributes*: All block-level annotations, except for tables and images, include text attribute tags. In addition to standard Chinese and English text, there are over 2,000 blocks with complex backgrounds and 146 with rotated text. (2) *Table Attributes*: Besides standard Chinese and English tables, there are 142 with complex backgrounds, 81 containing formulas, 150 with merged cells, and 7 vertical tables.

## 4. OmniDocBench Evaluation Methodology

To provide a fair and comprehensive evaluation for various models, we proposed an end-to-end evaluation pipeline consisting of several modules, including extraction, matching algorithm, and metric calculation, as shown in Figure 3. It ensures that OmniDocBench automatically performs unified evaluation on end-to-end DCE tasks, thereby producing reliable and effective evaluation results.

### 4.1. Extraction

**Preprocessing:** The model-generated markdown text should be preprocessed, which includes removing images, eliminating markdown tags at the beginning of the document, and standardizing the number of repeated characters.

**Special Component Extraction:** Extraction is primarily carried out using regular expression matching. To ensure that the extraction of content does not interfere with each other, it is necessary to follow a specific order. The extraction sequence is as follows: LaTeX tables, HTML ta-

bles, display formulas, markdown tables (which are then converted into HTML format), and code blocks.

**Pure Text Extraction:** After extracting special components, the remaining content is considered pure text. Paragraphs are separated by double line breaks, allowing them to participate in subsequent matching processes, thus aligning with reading order annotation units in the GTs. If no double line break exists, single line breaks are used for paragraph separation. Additionally, previously extracted code blocks are merged into the text category for processing.

**Inline Formula Format Converting:** We standardized inline formulas within paragraphs to Unicode format. This was necessary because different models produce inconsistent outputs for inline formulas. For formulas originally written in Unicode, it is hard to extract them using regular expressions. Therefore, to ensure a fair comparison, we do not extract inline formulas for separate evaluation. Instead, we include them in their Unicode format alongside the text paragraphs for evaluation.

**Reading Order Extraction:** Upon completion of the extraction, the start and end positions of the extracted content in the original markdown are recorded for subsequent reading order calculation.

### 4.2. Matching Algorithm

To avoid the impact of paragraph splitting on the final results, we proposed a method, Adjacency Search Match, that merges and splits paragraphs in both GTs and Preds to achieve the best possible match. The specific strategy involves: i) Calculate a matrix of Normalized Edit Distance between GTs and Preds. If the similarity between a Pred and a GT exceeds a specific threshold, they are considered a successful match. ii) For the rest, we apply fuzzy matching to determine whether one string is a subset of another string. If so, we further apply the truncation and merging algorithm which would try to merge adjacent paragraph. This process would continue to merge more paragraph until the Normalized Edit Distance starts to decrease. After this process, the best match will be found for GTs and Preds.

### 4.3. Metric Calculation

**Ignore Handling:** We implement an ignore logic for certain components in PDF page content, meaning they participate in matching but are excluded from metric calculations. This is mainly because of inconsistent output standards among models, which should not affect the validation results. For fairness, we ignore: (1) Headers, footers, page numbers, and page footnotes, which are handled inconsistently by different models. (2) Captions for figures, tables, and footnotes often have uncertain placement, complicating reading order. Additionally, some models embed table captions in HTML or LaTeX tables, while others treat them as plain text.

Table 7. Component-level Table Recognition evaluation on OmniDocBench table subset. (+/-) means *with/without* special situation.

extraction methods into three main classes:

**Pipeline Tools.** These methods integrate layout detection and various content recognition tasks (such as OCR, table recognition, and formula recognition) into a document parsing pipeline for content extraction. Prominent examples include MinerU [36], Marker [30], and Mathpix<sup>4</sup>.

**Expert VLMs.** These are large multimodal models specifically trained for document parsing tasks. Representative models include GOT-OCR2.0 [39] and Nougat [5].

**General VLMs.** These are general-purpose large multimodal models inherently capable of document parsing. Leading models in this category include GPT-4o [2], Qwen2-VL [38], and InternVL2 [6].

## 5.2. End-to-End Evaluation Results

Utilizing the OmniDocBench dataset and our evaluation framework, we conducted end-to-end assessments of mainstream document parsing methods, evaluating their performance from input PDF images to the resultant document parsing outputs.

**Overall Evaluation Results.** As illustrated in Table 2, pipeline tools specifically designed for document parsing, demonstrate superior performance across the board. MinerU and Mathpix achieved the best results for English and Chinese pages, respectively. In contrast, even the best general-purpose Vision Language Models (VLMs), GPT-4o, exhibits a performance gap compared to these specialized models, especially in Chinese. This trend is evident across sub-tasks like text recognition, formula recognition, and table recognition, where methods tailored for document parsing consistently outperform others. This advantage is largely due to the fine-tuning of these models on large datasets specific to document parsing tasks.

<sup>4</sup><https://mathpix.com/>

**Performance Across Diverse Page Types.** To gain deeper insights into model performance on diverse document types, we evaluated text recognition tasks across different page types. As shown in Table 3, an intriguing finding emerged: For commonly used data, such as academic papers and financial reports, pipeline tools perform well. However, for more specialized data like slides and handwritten notes, general VLMs demonstrate stronger generalization. The reason is clear: Pipeline tools and expert VLMs are relatively more constrained by the range of training data, whereas general VLMs having been trained on a wide variety of samples, maintained excellent recognition performance even in traditionally challenging long-tail scenarios, underscoring the value of VLMs.

**Performance on Pages with Specific Attributes.** For documents in OmniDocBench with attributes such as fuzzy scans, watermarks, and colorful backgrounds, our evaluation results are presented in Table 4. In these scenarios, the VLMs InternVL2 and Qwen2-VL exhibit the strongest resistance to interference, achieving the best accuracy and robustness. MinerU also performs commendably.

**Performance on Different Column Layout Types.** OmniDocBench annotates page attributes such as column layout type, which is crucial for analyzing model performance in reading order. As depicted in Table 5, all models experience a noticeable decline in reading order accuracy when dealing with complex layouts. MinerU and Mathpix excels in reading order across various column layouts, demonstrating robust performance across different page types.

From these end-to-end evaluations, it is evident that pipeline tools like MinerU and Mathpix, specifically designed for document parsing, achieve the best overall performance. However, in terms of versatility and scalability, VLMs offer a distinct advantage over pipeline tools. Fine-

Table 9. Component-level formula recognition evaluation on OmniDocBench formula subset.

tuning a general large model like Qwen2-VL with specialized data could yield models even more adept at document parsing, indicating a promising direction for future research in multimodal approaches.

The OmniDocBench dataset provides comprehensive annotations for document parsing, including layout detection, text boxes and content, formula boxes and content, and table boxes and content. These detailed annotations enable the evaluation of current state-of-the-art (SOTA) methods across various document types, allowing us to analyze their performance in diverse scenarios. Additionally, these results can be used to assemble enhanced pipeline tools for document parsing tasks.

### 5.3. Single Algorithm Evaluation Results

**Layout Detection Results.** Layout detection is the first step in document parsing using pipeline tools. A robust layout detection algorithm should perform well across a variety of document types. Table 6 presents an evaluation of leading layout detection models. The DocLayout-YOLO method, which is pre-trained on diverse synthetic document data, significantly outperforms other approaches. This superiority is a key factor in MinerU’s integration of DocLayout-YOLO, contributing to its outstanding overall performance. The table also reveals that, aside from DocLayout-YOLO, other methods perform well on books and academic literature but are less effective on other document types, primarily due to a lack of pre-training on diverse documents.

**Table Recognition Results.** Table recognition results evaluated by Tree-Edit-Distance-based Similarity (TEDS) met-

ric are presented in Table 7. We evaluate table recognition models across three dimensions on our OmniDocBench table subset: language diversity, table frame types, and special situations. Among all models, OCR-based models demonstrate superior overall performance, with RapidTable achieving the highest scores in language diversity and maintaining stable performance across different frame types. Expert VLMs show competitive results in specific scenarios, with StructEqTable [48] excelling in no frame tables and showing better rotation robustness. General VLMs (Qwen2-VL-7B and InternVL2-8B) exhibit relatively lower but consistent performance, suggesting that while general-purpose VLMs have made progress in table understanding, they still lag behind specialized solutions.

**Text Recognition Results.** In the traditional OCR task, Table 8 shows that PaddleOCR leads the field, surpassing other models significantly, with GOT also performing relatively well. Selecting these two methods for the OCR module is a prudent choice.

**Formula Recognition Results.** For formula recognition, the CDM metric provides a clear comparison in Table 9. GPT-4o, Mathpix, and UniMERNet achieve results of 86.8%, 86.6%, and 85.0%, respectively. Notably, GPT-4o excels with a recall rate of 65.5% under strict conditions requiring perfect character accuracy. Although Mathpix shows high character-level precision, it occasionally omits punctuation, such as commas, leading to a lower overall correctness rate. Nonetheless, all three models are strong candidates for formula recognition tasks.

## 6. Conclusion

This paper addresses the lack of diverse and realistic benchmarks in document parsing research by introducing OmniDocBench, a dataset featuring a variety of page types with comprehensive annotations, along with a flexible and reliable evaluation framework. OmniDocBench enables systematic and fair assessments of document parsing methods, providing crucial insights for advancing the field. Its task-specific and attribute-level evaluations facilitate targeted model optimization, promoting more robust and effective parsing solutions.

# OmniDocBench: Benchmarking Diverse PDF Document Parsing with Comprehensive Annotations

## Supplementary Material

### I. More End-to-End Evaluation Results

Table S1 presents the evaluation results of End2End Tables grouped by Table Attributes. As it shows, most of the models perform better in English Tables rather than Chinese ones. Most models perform relatively poorly with Full Frame and No Frame tables. The accuracy of most models is affected by special conditions. Merged cells and formulas mainly test the breadth of data the model can recognize, while colored backgrounds and table rotation test their robustness. The results show that table rotation significantly impacts the accuracy of all models. Pipeline Tools perform well on more challenging tables, but colored backgrounds can affect recognition accuracy. Several Vision Language Models (VLMs) tend to perform worse on tables with merged cells, but colored backgrounds do not significantly impact table recognition accuracy.

Table S2 shows the evaluation results of End2End Text blocks grouped by Text Attributes. Almost all models have lower recognition accuracy in Chinese compared to English. Some models, such as MinerU and Marker, experience a further decrease in accuracy when recognizing mixed Chinese and English content. Complex background colors significantly affect the recognition accuracy of pipeline tools, but they have little impact on VLMs.

### II. Dataset Statistics and Visualization

OmniDocBench contains 981 pages, including 9 types of PDF pages, 4 types of layouts, and 3 types of languages. Some pages also include special conditions, such as watermarks. Table S3 and Figure S1 show the number of pages with each page attribute. Figures S3 to S6 are examples of PDF pages with different PDF types, Layout Types, and Special Issues.

Table S6 and Figure S2 show all annotation categories included in OmniDocBench. All of them are annotated by bounding boxes. There are 15 types of block-level annotations and 4 types of span-level annotations, with span-level annotations nested within the block-level ones. In addition, there are 3 types of annotations marked as page interference information (No.20-22), whose bounding boxes are used to mask the specific regions of the PDF pages to avoid affecting the evaluation results. The recognition annotations are also provided for each annotation category except for Figures. Formulas is written in LaTeX format and Table is annotated in both HTML and LaTeX formats. Others are annotated in plain text.

Furthermore, the Text Attributes are also annotated for

each block-level category that contains text. There are 3 types of Text Attributes that might influent OCR accuracy: Language, Text Background Color, and Text Rotation. Table S5 shows the statistics of annotations with specific text attributes. There are 23,010 block-level annotations are labeled with text attributes.

Tables are also annotated with Table Attributes. There are 6 types of Table Attributes that might influent the Table Recognition accuracy: Language, Table Frame Type, Merge Cell, Colorful Background, Contain Formula, and Rotation. Table S5 shows the numbers of annotations with specific table attributes. Figures S7 and S8 are the examples of Tables with different Frames and Special Issues.

### III. Model Results Visualization

Figures S9 to S17 show the examples of Good model outputs and Bad model outputs of Document Parsing among different PDF types. As it shown, different models exhibit varying performance across different PDF types. For example, MinerU detects all handwritten notes as figures, resulting in very low recognition accuracy in Notes. Marker and InternVL2 experience missed detections, leading to lower scores. InternVL2 and Qwen2-VL, in specific PDF types (such as slides or financial reports), tend to merge multi-column text.

Figures S18 to S20 show the examples of Good model outputs and Bad model outputs under special issues of the PDF pages. It shows that Marker tends to generate typos when the PDF pages are fuzzy scanned or with watermarks, while GOT-OCR fails to recognize content on pages with colored backgrounds. MinerU performs well under special situations, while Mathpix occasionally generates typos.

Figures S21 to S24 show examples of Good model outputs and Bad model outputs for PDF pages with different layouts. MinerU has a low reading order score for single-column layouts primarily because most notes are single-column, and MinerU performs poorly in recognizing Notes, leading to a low reading order score accordingly. InternVL2 scores high in Single-Column layouts but scores poorly on Double-Column and Three-Column layouts. It is mainly due to frequent missed content recognition and errors in reading order judgment in multi-column layouts pages. MinerU's reading order and recognition accuracy decrease with complex layouts, primarily because it incorrectly merges multiple columns during recognition.

Figures S27 and S28 show the model's recognition ability under special issues of text. In text recognition with

Table S2. End-to-End Text Normalized Edit Distance results grouped by Text Attributes. “Mixed” represents a mixture of Chinese and English, “Single” and “Multi” represent single color and multi color.

complex background colors, Marker may produce errors or miss content, whereas Qwen2-VL still performs well. Most models fail to recognize text when it is rotated 270 degrees. Some vision language models generate hallucinated information based on the content they can recognize.

Figures S29 to S32 show the examples of good and bad model results for tables with different attributes. For three-line tables, RapidTable demonstrates a good performance with accurate structure recognition, while PaddleOCR shows limitations by missing the last column in its outputs. Interestingly, in tables without frames, PaddleOCR performs well with accurate table predictions, while Qwen2-VL-7B exhibits errors in the last two columns. This indicates that the presence or absence of table frames can significantly impact different models’ performance in different ways. Rotated tables prove to be particularly challenging, with most models, including GOT-OCR, failing to recognize the table structure. However, StructEqTable shows promising results by correctly identifying most of the table content, though with a few detail errors. For tables containing formula, Qwen2-VL-7B shows more accurate table structure recognition compared to InternVL2-8B.

## IV. Model Settings

For pipeline tools such as MinerU, Marker, and Mathpix, default settings are used for evaluation. Specifically, MinerU with Version 0.9.3<sup>5</sup> is employed. For Marker, Version 0.2.17<sup>6</sup> is evaluated. For Nougat, we utilize its 0.1.0-base model (350M). For GOT-OCR, we employ its format OCR mode to output structured data. For general VLMs, we used the GPT4o, Qwen2-VL-72B, and InternVL2-Llama3-76B by setting the *do\_sample=False* to ensure the reproducibility.

Chapter 2 | Descriptive Statistics

152. Four quartiles = \$26.5 FTEs  
 • third quartile = 1,447.5 FTEs  
 • n = 29 years

**94.** A sample of 11 years is taken. About how many are expected to have a FTEs of 1014 or above? Explain how you determined your answer.

**95.** 75% of all years have an FTEs:  
 a. less than 1,000  
 b. at or above 1,000

**96.** The population standard deviation = ?

**97.** What was the range of the FTEs from 2005 to 1447.5? How do you know?

**98.** Is it possible to have 100% of the FTEs as 100%?

**99.** How many standard deviations away from the mean is the median?

**Additional Information:** The population FTEs for 2005–2006 through 2010–2011 was given in an updated report. The data are repeated here:

Year	2005–06	2006–07	2007–08	2008–09	2009–10	2010–11
Total FTEs	1,500	1,600	1,700	1,900	2,000	1,800

Value 2.73

**100.** Calculate the mean, median, standard deviation, the first quartile, the third quartile and the IQR. Round to one decimal place.

**101.** What additional information is needed to construct a box plot for the FTEs for 2005–2006 through 2010–2011 and a box plot for the FTEs for 1976–1977 through 2004–2005?

**102.** Compare the mean FTEs for 1976–77 through 2004–2005 with the IQR for the FTEs for 2005–2006 through 2010–2011. Which is larger? Explain why.

**103.** Three students were applying to the same graduate school. They came from schools with different grading systems. Which student had the best GPA when compared to other students at his school? Explain how you determined your answer.

Student	School	Average GPA	School Standard Deviation
Thay	2.7	3.2	0.8
Vichet	97	75	20
Kamala	8.6	8	0.4

Value 2.74

**104.** A music school has budgeted to purchase three musical instruments. They plan to purchase a piano costing \$3,000, a guitar costing \$500, and a drum set costing \$600. The mean cost for a piano is \$4,000 with a standard deviation of \$2,500. The mean cost for a guitar is \$500 with a standard deviation of \$200. The mean cost for drums is \$700 with a standard deviation of \$100. Which is the lowest, when compared to other instruments of the same type? Which cost is the highest when compared to other instruments of the same type?

**105.** An elementary school class has one minute of a 11 minutes and a standard deviation of three minutes. Rachel, a student in the class, ran one mile in eight minutes. A junior high school class ran one mile with a mean of nine minutes and a standard deviation of two minutes. A senior high school class ran one mile with a mean of ten minutes and a standard deviation of one minute. Nedda, a student in the class, ran one mile with a mean of seven minutes and a standard deviation of four minutes. Nedda, a student in the class, ran one mile in eight minutes.

a. Why is Nedda considered a better runner than Nedda, even though Nedda ran faster than?

b. Who is the fastest runner with respect to his or her class? Explain why.

# A New Capacitorless 1T DRAM Cell: Surrounding Gate MOSFET With Vertical Channel (SGVC Cell)

Hoon Jeong, Ki-Whan Song, Il-Hun Park, Tae-Hyun Kim, Young-Jae Lee, Seung-Goo Kim, Jun Seo, Kyung-Soo Cho, Kang-Yeon Lee, and Sung-Jae Kim, *IEEE Solid-State Circuits Member, IEEE*, and Byung-Gook Park, *Member, IEEE*

**Abstract** We propose a surrounding gate MOSFET with vertical channel (SGVC) cell, which can realize a capacitorless memory operation of the SGVC cell by simulating its memory effect and fabricated the highly scalable SGVC cell. According to the simulation results, the SGVC cell has a better performance than 1T DRAM having a sufficiently large sensing margin. Also, due to the surrounding gate structure, the SGVC cell can have more source ambits, so it can readily be made into a 4<sup>2</sup>-bit array.

**Index Terms** Memory effect, 1T DRAM cell, sensing margin, surrounding gate, threshold.

## I. INTRODUCTION

To overcome the reliability issues and process complexity of conventional capacitor DRAM cell, as p-channel transistor (1T) DRAM cells have been recently proposed and investigated [1]. The main idea of 1T DRAM cell is to eliminate the capacitor, which is replaced by a MOSFET with its body floating electrically. The FET is realized by a MOSFET formed on partially dielectrically isolated body. When the body is floating in the floating body, the threshold voltage is defined as “I” (decreased  $V_{th}$ ). On the other hand, when excess holes are accumulated at the floating body, the threshold voltage is increased and the state is defined as “0” (increased  $V_{th}$ ). By measuring the drain current, we can distinguish between “I” and “0”. We can sense whether the holes are accumulated in the floating body. Because the floating body is used as the storage node, the floating body must be isolated from the substrate. Therefore, it has a simple process and can have a cell area below  $4\text{ }\mu\text{m}^2$  [1]. In this work, we propose a surrounding-gate MOSFET with vertical channel (SGVC) cell, which can realize a capacitorless memory operation of the SGVC cell by simulating its memory effect and fabricated the highly scalable SGVC cell. According to the simulation results, the SGVC cell has a better performance than 1T DRAM having a sufficiently large sensing margin. Also, due to the surrounding gate structure, the SGVC cell can have more source ambits, so it can readily be made into a 4<sup>2</sup>-bit array.

Manuscript received June 18, 2006; revised December 8, 2006. This work was sponsored by the Korea Science and Engineering Foundation. The work of this paper was arranged by Associate Editor T. Hiramoto.

The authors would like to thank Dr. S. H. Kim and Dr. B.-C. Park at the School of Electrical Engineering, Seoul National University, Seoul, 151-742, Korea, and Prof. J. K. Kim and Dr. K. Lee at the Semiconductor Technology Development Team, Samsung Electronics, Suwon, Korea, for their support. This work was supported by the Korea Science and Engineering Foundation under Contract R01-2005-00550 and by the Korea Ministry of Science and Technology under Contract M105-2005-00550.

TABLE I  
SGVC CELL SIMULATION PARAMETERS

Program (10)	Read (Impact ionization)
Gate Voltage	1V
Drain Voltage	1.5V (4 V)
Sense Voltage	8V
Logic (length=0.1 nm) $\alpha_{SOI}$ (gate oxide thickness)	
(Polar) Dose (mJ/cm <sup>2</sup> )	
N <sub>A</sub> (nonsource region) $\times 10^{-14}$ cm <sup>2</sup> (graded doping)	
N <sub>D</sub> (body doping) $\times 10^{19}$ cm <sup>-3</sup>	
Temperature	-10 m

FET structure possible and ultimately leads to superior scalability. The memory operation has been investigated by simulation. Also, we have successfully fabricated a highly scalable SGVC cell and the memory effect is measured for the first time.

## II. SIMULATION RESULTS

Figure 1 schematically shows the operation principle of an SGVC cell [4]. It can be noticed that it has a floating body structure. To verify memory cell operation, 2D device simulation was performed. We used ATLAS as a simulator. Excess holes are generated by impact ionization in the floating body. Figure 2 shows the potential of each state and the  $L_g-V_{th}$  characteristics were extracted first, in order to show the memory effect. Figure 3 shows the drain current ( $I_d$ ) versus the drain voltage ( $V_d$ ). Figure 4 shows the drain current ( $I_d$ ) versus the drain voltage ( $V_d$ ) when the drain voltage is varied from -10 mV to 10 mV. Figure 5 shows the drain current ( $I_d$ ) versus the drain voltage ( $V_d$ ) when the drain voltage is varied from -10 mV to 10 mV. This is due to the increase of the body potential when holes are accumulated into the floating body. The drain current ( $I_d$ ) increases with the floating body voltage, which in turn increases the drain current. Subsequently, the drain current as a function of time was extracted to show

# Table contain Formula

## 第三章 铁 金属材料

素呈+3价，在进行有关氧化还原反应的计算时，可将Fe元素的化合价看作 $\frac{5}{3}$ 价。

Fe<sub>2</sub>O<sub>3</sub>可以用FeO·Fe<sub>2</sub>O来表示，但Fe<sub>2</sub>O<sub>3</sub>是化合物，是一种纯净物，不能将Fe<sub>2</sub>O看成是由FeO和Fe<sub>3</sub>O<sub>4</sub>组成的混合物。

问题3 金属阳离子还是应该一定得到金属单质吗？

不一定，在某种条件下，金属可能从较低价态还还原到较低价态，但仍为化合物，如铁粉与氯化铁溶液的反应： $Fe + 2Fe^{3+} \rightleftharpoons 3Fe^{2+}$ 。

第3课 铁及其化合物

● 铁的氧化物是一类常用的磁性材料，制得的强磁性四氧化三铁用来录音录像带和计算机硬盘基板，激光打印机墨粉也含有二氧化钛。

## K 应试拓展注意

### 拓展1 铁的氧化物和氢氧化物

#### 1. 铁的氧化物比较

名称	氧化亚铁	氧化铁(俗称铁红)	四氧化三铁(俗称磁性氧化铁)
化学式	FeO	Fe <sub>2</sub> O <sub>3</sub>	Fe <sub>3</sub> O <sub>4</sub>
颜色、状态	黑色粉末	红棕色粉末	黑色晶体
铁的价态	+2价	+3价	+2,+3价
水溶性	能溶于水	难溶于水	不溶于水
与非氧化性酸反应	$Fe + 2H^+ \rightleftharpoons Fe^{2+} + H_2O$	$Fe_{2}O_3 + 6H^+ \rightleftharpoons 2Fe^{3+} + 3H_2O$	$Fe_3O_4 + 8H^+ \rightleftharpoons Fe^{2+} + 2Fe^{3+} + 4H_2O$
$H_2 + CO$ $Al$ 等单质 与之反应	$FeO + H_2 \xrightarrow{\Delta} Fe + H_2O$	$Fe_2O_3 + 3CO \xrightarrow{\Delta} 2Fe + 3CO_2$	$3Fe_3O_4 + 8Al \xrightarrow{\Delta} 9Fe + 4Al_2O_3$

◆ 放在红壤上显红色主要是因为含有 $Fe_2O_3$ 。

【说明】(1) Fe不稳定，易被氧化为 $Fe_2O_3$ 。

(2)  $Fe_2O_3$ 遇氧化性酸( $HNO_3$ )发生氧化还原反应，+2价的铁均被氧化为+3价。

(3)  $Fe_2O_3$ 、 $Fe_3O_4$ 均为碱性氧化物， $FeO$ 是复杂的氧化物，不属于碱性氧化物。

◆ 铁的氢氧化物较

名称	氢氧化亚铁	氢氧化铁
化学式	Fe(OH) <sub>2</sub>	Fe(OH) <sub>3</sub>
颜色、状态	白色固体	红褐色固体
水溶性	不溶	不溶
与酸反应	$Fe(OH)_2 + 2H^+ \rightleftharpoons Fe^{2+} + 2H_2O$	$Fe(OH)_3 + 3H^+ \rightleftharpoons Fe^{3+} + 3H_2O$
稳定性	不稳定，在空气中会由白色变为灰绿色，最后变为红褐色： $4Fe(OH)_2 + O_2 + 2H_2O \longrightarrow 4Fe(OH)_3$	常温下稳定，加热分解： $2Fe(OH)_3 \xrightarrow{\Delta} Fe_2O_3 + 3H_2O$
制备	$Fe^{2+} + 2OH^- \rightleftharpoons Fe(OH)_2↓$ (必须在非氧化性环境中制备)	$Fe^{3+} + 3OH^- \rightleftharpoons Fe(OH)_3↓$

◆  $Fe(OH)_2$ ，为白色状固体，在空气中不稳定，会由白色变为灰绿色，最后变为红褐色， $4Fe(OH)_2 + O_2 + 2H_2O \longrightarrow 4Fe(OH)_3$ 。

◆  $Fe(OH)_3$ ，为白色状固体，在空气中常温下稳定，加热分解： $2Fe(OH)_3 \xrightarrow{\Delta} Fe_2O_3 + 3H_2O$ 。常温下稳定，加热分解： $2Fe(OH)_3 \xrightarrow{\Delta} Fe_2O_3 + 3H_2O$ 。

◆  $Fe(OH)_2$ ，为白色状固体，在空气中不稳定，会由白色变为灰绿色，最后变为红褐色， $4Fe(OH)_2 + O_2 + 2H_2O \longrightarrow 4Fe(OH)_3$ 。

◆  $Fe(OH)_3$ ，为白色状固体，在空气中常温下稳定，加热分解： $2Fe(OH)_3 \xrightarrow{\Delta} Fe_2O_3 + 3H_2O$ 。

◆  $Fe(OH)_2$ ，为白色状固体，在空气中不稳定，会由白色变为灰绿色，最后变为红褐色， $4Fe(OH)_2 + O_2 + 2H_2O \longrightarrow 4Fe(OH)_3$ 。

◆  $Fe(OH)_3$ ，为白色状固体，在空气中常温下稳定，加热分解： $2Fe(OH)_3 \xrightarrow{\Delta} Fe_2O_3 + 3H_2O$ 。

◆  $Fe(OH)_2$ ，为白色状固体，在空气中不稳定，会由白色变为灰绿色，最后变为红褐色， $4Fe(OH)_2 + O_2 + 2H_2O \longrightarrow 4Fe(OH)_3$ 。

◆  $Fe(OH)_3$ ，为白色状固体，在空气中常温下稳定，加热分解： $2Fe(OH)_3 \xrightarrow{\Delta} Fe_2O_3 + 3H_2O$ 。

## Academic Papers

Content	Markdown Content (MinerU)	Markdown Content (InternVL2)
usually have partial myelitis and characteristically have asymmetric clinical findings with predominantly sensory or motor MRI lesions. .... . In our cohort over less than two years, 10% of patients had more than one lesion. As in the other subtypes of CIS, abnormal brain MRI results is the most common presentation. .... . Notably, none of our 20 patients with optic and normal baseline MRI results had a new T1 lesion in the 1-year MRI, nor a new T2 lesion in the 1-year MRI after a mean follow-up of 44 months (data not shown).	usually have partial myelitis and characteristically have asymmetric clinical findings with predominantly sensory or motor MRI lesions. .... . In our cohort over less than two years, 10% of patients had more than one lesion. As in the other subtypes of CIS, abnormal brain MRI results is the most common presentation. .... . Notably, none of our 20 patients with optic and normal baseline MRI results had a new T1 lesion in the 1-year MRI, nor a new T2 lesion in the 1-year MRI after a mean follow-up of 44 months (data not shown).	
CIS can present as optic neuritis, or spinal cord syndromes, or spinal cord syndromes. Less common initial episodes suggestive of central nervous system demyelination can occur. .... . Optic neuritis and spinal cord syndromes have not been specifically studied. In our cohort, only 30 patients (4%) had an initial attack different from CIS. .... . One had a neurological syndrome of undetermined topography. In our cohort, there are insufficient numbers to determine whether the initial presentation of what is multifocal or polyfocal needs to be achieved, and a greater number of patients will be required.	CIS classically refer to ON, brainstem syndromes, or spinal cord syndromes. .... . A consensus definition of what is multifocal or polyfocal needs to be achieved, and a greater number of patients with such characteristics should be studied.	
The apparent discrepancy between natural history studies that claimed that the ON has a better outcome and the apparent discrepancy between natural history studies that do not show differences in outcomes among different topographies may be explained by the heterogeneity of the patients. .... . Patients with CIS who have symptoms with ON may have a better outcome because, as a group, they have more chances for recovery because less MRI lesions are present. .... . The CIS:ON differential diagnosis in patients with subacute visual loss is a challenging, and often difficult, task that mimic inflammatory disease. .... . ON are difficult to identify. Nevertheless, if a patient with ON has abnormal baseline MRI, the natural history of the disease may differ from that of other patients with different CISs. MRI at baseline, not CIS topography, appears to be the crucial issue at MS presentation.	The apparent discrepancy between natural history studies that claimed that ON has a better outcome ..... . MRI at baseline, not CIS topography, appears to be the crucial issue at MS presentation.

<b>Creating Dialog Boxes</b>		
Dialog boxes may be created in one of two ways:		
▪ Using the function <code>GetOKCancelButtons</code> , which takes descriptive information about the dialog from the <code>OK</code> and <code>Cancel</code> push buttons. .... . The <code>OK</code> button is the default for this push button, and the <code>Cancel</code> button is optional. The default text for this push button is "Don't Care".		
▪ Using <code>NewDialog</code> , <code>NewOKCancelDialog</code> , or <code>NewFeaturesDialog</code> , which take descriptive information passed in the parameters of those functions.		
<b>Historical Note</b>		
The extended dialog resource and the <code>SetResourceDialog</code> function were introduced with OS 8 and the Appearance Manager. <code>SetResourceDialog</code> should be used to create Appearance-compliant dialog boxes. .... . The <code>SetResourceDialog</code> function takes a <code>Dialog</code> parameter, which you would set in a <code>ResourceRecord</code> dialog box.		
If <code>null</code> is specified as the second parameter in the <code>SetResourceDialog</code> call, <code>SetResourceDialog</code> itself creates a non-relocatable block for the dialog structure. Passing <code>null</code> is appropriate for modal and movable modal dialog boxes. .... . If you want to create a dialog structure that is not modal or movable, and you want to avoid the user dismissing the dialog. However, in order to avoid heap fragmentation issues, when you are done with your dialog box, you should make sure to release the dialog box's memory (just like you would for a window structure) and specify the pointer to that memory block in the <code>SetResourceDialog</code> call.		
Regardless of which method is used to create the dialog, a <code>dialog structure</code> and a <code>window structure</code> will be created, and a pointer to the dialog structure will be returned to the calling function.		
<b>The Dialog Structure</b>		
The dialog structure created by the <code>GetOKCancelButtons</code> cell is defined by the data type <code>DataRecord</code> :		
<pre>struct DataRecord {     WindowRecord window; // Dialog's window record.     // Dialog's window record. Handle items; // Item list resource.     TEHandle textH; // Current editable text item.     SInt16 editField; // Editable text item number minus 1.     SInt16 editOpen; // (Used internally.)     SInt16 aDefItem; // Default push button item number. };..... The Dialog Manager sets the windowKind field of this window structure to kDialogWindowKind.</pre>		
Note that the dialog structure includes a <code>window structure</code> field. The Dialog Manager sets the <code>windowKind</code> field of this window structure to <code>kDialogWindowKind</code> .

# 第四章 主食类
## 葱油面
```

**材料成分**

- \*\*主料\*\*：香葱 500g, 大葱 500g, 紫葱头 500g, 切面 (细) 5kg;
- \*\*辅料\*\*：水 300g, 油菜 500g, 食用油 500g;
- \*\*调料\*\*：酱油 1kg。

**制作过程**

香葱切段，大葱、葱头切丝，油菜切开备用；葱油制作：锅内放油烧至三成熟，将香葱、大葱、葱头入锅小火熬制20分钟后加酱油、水，开锅10分钟盛出；锅中煮面条的同时放一个小油菜，煮熟后浇上葱油，撒上香葱粒即可（原料按35碗计算）。

**工艺技巧**

面条要细；熬油温度不宜太高。

**品质特点**

柔韧爽滑，葱香可口。

1992年6月，《21世纪议程》破坏环境→可持续发展
4. 城市化问题
(1) 人口和城市的分布
① 特点：人口分布极不平衡，90%的人口居住在东部沿海地带，而且大城市占十分之七。
② 带来许多“城市病”：交通拥堵、住房困难、就业紧张、污染严重、犯罪增多。
③ 解决措施：进行合理的城市规划，建立卫星城；城市中工业和人口向郊区分散；加强城市管理，重视保护和治理城市环境。
(2) 主要城市：
圣保罗：经济中心、最大的城市和工业中心。
里约热内卢：商业和金融中心、第二大城市。
巴西利亚：政治中心、首都，是新建城市。

**Textbooks**

通过简单的推理或试验，可以发现：

(1) 从1到6的每一个点数都有可能出现，所有可能的点数共有6种，但是事先无法预料哪一次骰子会出现哪一种结果；  
 (2) 出现的点数肯定大于0；  
 (3) 出现的点数绝对不会是7；  
 (4) 出现的点数可能是4，也可能不是4，事先无法确定。

在一定条件下，有些事件必然会发生。例如，问题1中“抽到的数字小于6”，问题2中“出现的点数大于0”。这样的事件称为必然事件。相反地，有些事件必然不会发生。例如，问题1中“抽到的数字是0”，问题2中“出现的点数是7”。这样的事件称为不可能事件，必然事件与不可能事件统称确定性事件。

在一定条件下，有些事件有可能发生，也有可能不发生，事先无法确定。例如，问题1中“抽到的数字是1”，问题2中“出现的点数是4”。这两个事件是否发生事先不能确定，在一定条件下，可能发生也可能不发生的事件，称为随机事件（Random event）。

你还能举出一些随机事件的例子吗？

**练习**

指出下列事件中，哪些是必然事件，哪些是不可能事件，哪些是随机事件。  
 (1) 通常加热到100℃时，水沸腾；  
 (2) 蓝球队员在罚球线上投篮一次，未投中；  
 (3) 投一枚骰子，向上一面的点数是6；  
 (4) 任意选一个三角形，其内角和是360°；  
 (5) 经过交通信号灯的路口，遇到红灯；  
 (6) 射击运动员射击一次，命中靶心。

第二章 数列

因为  $a_n = a_1 q^{n-1}$ ，所以上面的公式还可以写成  
 $S_n = \frac{a_1 - a_1 q^n}{1 - q}$  ( $q \neq 1$ )。

有了上述公式，就可以解决本节开头提出的问题。由  $a_1 = 1$ ,  $q = 2$ ,  $n = 64$ , 可得  
 $S_n = \frac{a_1 (1 - q^n)}{1 - q} = \frac{1 \times (1 - 2^{64})}{1 - 2} = 2^{64} - 1$ 。

2<sup>64</sup>-1这个数很大，超过了  $1.84 \times 10^{19}$ 。假定千粒麦子的质量为 40 g，那么麦粒的总质量超过了 7000 亿吨，因此，国王不能实现他的诺言。

**例 1** 求下列等比数列前 8 项的和：  
 (1)  $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \dots$   
 (2)  $a_1 = 27, a_n = \frac{1}{243}, q < 0$ 。

解：(1) 因为  $a_1 = 1, q = \frac{1}{2}$ ，所以当  $n=8$  时，  
 $S_n = \frac{\frac{1}{2} [1 - (\frac{1}{2})^8]}{1 - \frac{1}{2}} = \frac{255}{256}$ 。  
 (2) 由  $a_1 = 27, a_n = \frac{1}{243}$ ，可得  
 $\frac{1}{243} = 27 \cdot q^7$ 。  
 又由  $q < 0$ ，可得  
 $q = -\frac{1}{3}$ 。  
 于是当  $n=8$  时，  
 $S_n = \frac{27 [1 - (-\frac{1}{3})^8]}{1 - (-\frac{1}{3})} = \frac{1640}{81}$ 。

**Markdown Content (MinerU)**

第二章 数列

-----Missing Paragraphs-----

因为  $S_n = a_1 + a_2 + \dots + a_n$ ，所以上面的公式还可以写成  
 $S_n = \frac{a_1 (1 - q^n)}{1 - q}$  ( $q \neq 1$ )。

有了上述公式，就可以解决本节开头提出的问题。由  $a_1 = 1, q = 2, n = 64$ ，可得  
 $S_n = \frac{1 \times (1 - 2^{64})}{1 - 2} = 2^{64} - 1$ 。

$2^{64}-1$ 这个数很大，超过了  $1.84 \times 10^{19}$ 。假定千粒麦子的质量为 40 g，那么麦粒的总质量超过了 7000 亿吨，因此，国王不能实现他的诺言。

**例 1** 求下列等比数列前 8 项的和：  
 (1)  $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \dots$   
 (2)  $a_1 = 27, a_n = \frac{1}{243}, q < 0$ 。

解：(1) 因为  $S_n = a_1 + a_2 + \dots + a_n$ ，所以当  $n=8$  时，  
 $S_n = \frac{a_1 (1 - q^n)}{1 - q} = \frac{1 \times (1 - 2^{64})}{1 - 2} = 2^{64} - 1$ 。  
 (2) 由  $S_n = a_1 + a_2 + \dots + a_n$ ，可得  
 $S_n = \frac{a_1 (1 - q^n)}{1 - q} = \frac{27 (1 - (\frac{1}{3})^8)}{1 - (-\frac{1}{3})} = \frac{27 (1 - \frac{1}{6561})}{1 + \frac{1}{3}} = \frac{27 \times 6560}{6561} = \frac{1640}{81}$ 。

又由  $q < 0$ ，可得  
 $S_n = \frac{27 (1 - (\frac{1}{3})^8)}{1 - (-\frac{1}{3})} = \frac{1640}{81}$ 。

于是当  $n=8$  时，  
 $S_n = \frac{27 (1 - (\frac{1}{3})^8)}{1 - (-\frac{1}{3})} = \frac{1640}{81}$ 。

**Markdown Content (Marker)**

(0\_image\_0.png)  
**-----Missing Paragraphs-----**  
 因为  $a_1 = a_1 q^{n-1}$ ，所以上面的公式还可以写成  $S_n = a_1 + a_2 + \dots + a_n$ 。  
 1-q 有了上述公式，就可以解决本节开头提出的问题。由  $a_1 = 1, q = 2, n = 64$ ，可得  
 $S_n = \frac{1 - 2^{64}}{1 - 2} = 2^{64} - 1$ 。  
 $2^{64}-1$ 这个数很大，超过了  $1.84 \times 10^{19}$ 。假定千粒麦子的质量为 40 g，那么麦粒的总质量超过了 7000 亿吨，因此，国王不能实现他的诺言。

求下列等比数列前 8 项的和：例 1 (1) - (2)  $a_1 = 27, a_n = 243$ ,  $q < 0$ 。解：(1) 因为  $a_1 = 1, q = -\frac{1}{3}$ ，所以当  $n=8$  时， $S_n = \frac{1 - (-\frac{1}{3})^8}{1 - (-\frac{1}{3})} = \frac{255}{256}$ 。  
 (2) 由  $a_1 = 27, a_n = 243$ ，可得  
 $243 = 27 \cdot q^7$ 。  
 $q = 3$ 。  
 于是当  $n=8$  时，  
 $S_n = \frac{27 [1 - 3^8]}{1 - 3} = \frac{1640}{81}$ 。

<p>Bull Environ Contam Toxicol (2007) 78:304–307</p> <p>1 Velho to Rio Comprido, with 772 m length each roughly 7 cm diameter, tunnel cross section is 81 <math>\text{cm}^2</math> in both bore. Concrete wall separating the two boreholes. There is no traffic and no people. Each gallery has three lanes. CO concentrations and the 1 h average were first measured by the gas placed near the roof (Rebouças 2006). The daily traffic volume ranges from 10,000 to 15,000 vehicles per day. Light-duty vehicles (LDV) represent roughly 95% of the local traffic, while diesel vehicles and motorcycles account for 2.8% and 2.2%, respectively.</p> <p>2 Aromatic compounds were sampled and analyzed using a methodology based on US-EPA methods (1996). Aromatics were collected in 10 mL glass vials containing 7 cm long, 4 mm ID, containing 2 sections of activated carbon shell (charcoal) (main section 10 mg, second section 1 mg) and 1 mL of dichloromethane (DCM) (Sigma-Aldrich, St. Louis, MO, USA). Samples were held for 1 h, at a flow rate of 1.0 L min<sup>-1</sup>. The second section of tube was analyzed in order to detect breakthrough.</p> <p>3 Charcoal beds in the tubes were transferred to 2 mL vials and extracted by adding 1.0 mL of <math>\text{CHCl}_3</math> (Sigma-Aldrich, St. Louis, MO, USA). The sample was added prior to extraction as internal standard. The samples were analyzed using a Trace GC coupled DSQ Quantum mass spectrometer (Thermo Electron Corporation, Waltham, MA, USA). The ion source temperature column used was a DB-5 (5% phenyl-methylsiloxane) column (J&amp;W Scientific, 60 m long, 0.25 mm internal diameter, 0.25 <math>\mu\text{m}</math> film thickness). The carrier gas helium at 1 <math>\text{L} \cdot \text{min}^{-1}</math> and 25 <math>\text{cm} \cdot \text{s}^{-1}</math> linear velocity. The injection mode was splitless with inlet temperature of 240°C and detector temperature of 250°C. The transfer line temperature was 240°C and the interface temperature 45–200°C at 6 <math>^{\circ}\text{C} \cdot \text{min}^{-1}</math>, held for 5 min. Mass spectrometer ionization was electronic impact and ion source temperature was 200°C. The ion source was maintained at 150 and 250°C, respectively.</p> <p>4 The profiles of the VOCs were measured using GC-MS. For each compound, two ions (one target and one qualifier) were monitored. Compounds were identified based on their relative retention times and ion ratios. Identified compounds were quantified using the external standard method, with five levels of calibration as follows: 0.1, 1, 5, 25, 100 <math>\mu\text{g} \cdot \text{mL}^{-1}</math> in <math>\text{CHCl}_3</math>. All 1 g <math>\text{mL}^{-1}</math> of benzene, toluene, ethylbenzene and xylenes (BTEX) were purchased from Supelco. Correlation coefficients were evaluated and <math>p &lt; 0.05</math>.</p> <p>5 The reproducibility of the results was checked by analyzing duplicate samples and the difference between the two analyses. The uncertainties of the results were calculated, using the data of the detection curves, as: benzene 0.9%, toluene 10%, ethylbenzene 21%, m-, p-xylene 8% and o-xylene 12%.</p> <p>6 Results and Discussion Velho to Rio Comprido, with 772 <math>\text{m}</math> length each roughly. 1	69428 Federal Register / Vol. 81, No. 194/Thursday, October 6, 2016/Rules and Regulations	Based on our review of the best available scientific and commercial information pertaining to the Act's five listing criteria, we conclude that the Arkansas darter is not currently threatened or likely to become so in the foreseeable future. We have evaluated the best available scientific and commercial information pertaining to the Act's five listing criteria for the Arkansas darter. The Service published a proposed rule to list the Arkansas darter as threatened under our DPS Policy. An environmental impact statement (EIS) was issued for the proposed rule on September 10, 2010, and a biological opinion (BI) was issued for the proposed rule on November 16, 2010. CNOR. This document contains the results of the settlement agreement for the proposed rule and the status review for the Arkansas darter. A detailed discussion of the basis for this finding can be found in the proposed rule, the environmental impact statement, or the Biological Opinion. Below are the key findings from the supporting documents (see ADDRESSES section).	2	69428 Federal Register / Vol. 81, No. 194/Thursday, October 6, 2016/Rules and Regulations	-----
